What is a "rare disease"?

❖ *Europe:* a disease is considered as *rare* when it affects 1 person per 2,000 (Prevalence <0.05%)

What is an "orphan disease"?

The term "orphan" denotes diseases that either because of their rarity or paucity of therapeutic options are less well understood by patients and their caregivers

Du Bois RM . Am J Respir Crit Care Med 2002; 166: 1157

Global effort against rare and orphan diseases

- ***Increasing incidence of rare diseases and growing research efforts***
- Translational research

LAM

LYMPHANGIOLEIOMYOMATOSIS

- Lymphangioleiomyomatosis (LAM) is a rare multisystem disorder affecting predominantly young females in their reproductive years.

- It is characterised by progressive cystic destruction of the lung, lymphatic abnormalities and abdominal tumours (e.g. renal angiomyolipomas, lymphangioleiomyomas)

- It can be sporadic (3,5-8/million women) or associated with TSC (30-40% of patients), an autosomal dominant syndrome characterised by hamartoma formation in multiple organ systems, cerebral calcifications, seizures and cognitive defects

LYMPHANGIOLEIOMYOMATOSIS

➢ LAM shares so many genetic, molecular, and pathological aspects with a neoplasm that it can be referred to as *a slow progressive tumor*

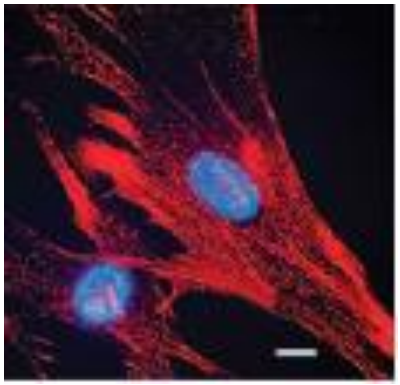
- Mutations
- Inappropriate growth and survival
- Metastasis via blood and lymphatic circulation
- Infiltration
- Tissue destruction
- Sex steroid sensitivity

➢ It has a good biomarker for diagnosis, monitoring of disease and prediction of answer to therapy: VEGF-D

➢ It has an effective and relatively safe treatment which can stop or slow down the progression of the disease: sirolimus (mTOR inhibitor)

- Side effects: Mouth ulcers, diarrhea, upper respiratory infections, hypercholesterolemia, acneiform rash
- Non responders

LAM cells



Smooth muscle actin

The multisystem manifestations of LAM are believed to result from metastatic dissemination of abnormal smooth muscle-like cells: LAM cells.

- In tissues, LAM cells are heterogeneous, ranging from small and round or spindle-shaped to large and epithelioid.

- LAM cells do differ from normal smooth muscle cells by the presence of gp100, a glycoprotein found in melanoma that reacts with a monoclonal antibody, HMB45.

- In blood, they can be enriched by flow-cytometry using CD45 and CD235a antibodies to remove leukocytes and red blood cells *(Crooks et al, 2004).*

- Two cell surface proteins, CD44v6 and CD9, have been identified for the isolation of disseminated LAM cells from BALF, urine and chylous effusions *(Cai et al, 2010).*

LAM cells

- LAM cell growth is caused at least in part by mutational inactivation of the tumor suppressor genes Tuberous Sclerosis Complex 1(TSC1) or TSC2.
- The mutations found most frequently in sporadic LAM is TSC2 loss of heterozygosity (LOH) on chromosome 16p13 .
- Loss of TSC2 protein function results in hyperactivation of the mTORC1 signaling pathway leading to dysregulated cell growth and cell viability.

European Respiratory *review*

Lymphangioleiomyomatosis: what do we know and what are we looking for?

Recent progress in our understanding of the molecular pathogenesis of LAM and muscle cell biology provides a foundation for the development of new therapeutic strategies. Inhibitors of mTOR and inhibitors of MMPs and angiogenesis are the most promising areas of research.

Harari S et al. Eur Respir Rev. 2011;20:34-44

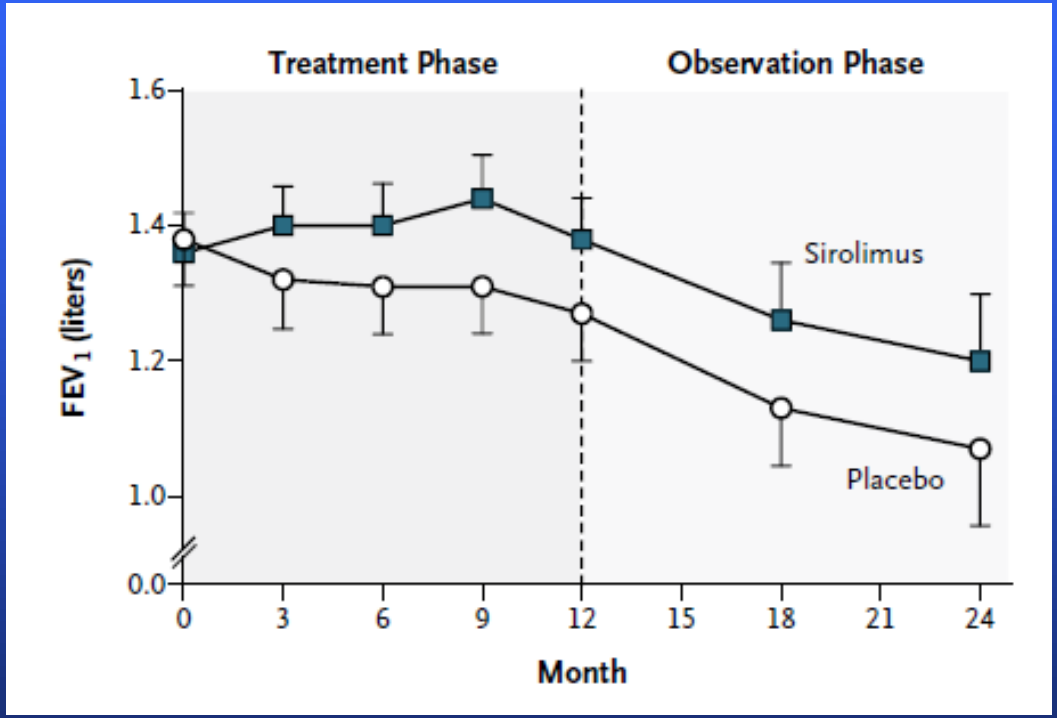
2015	***RAD001X2201*** *(Everolimus)*	*Open-label, within-patient multiple dose escalation in LAM*	*Waiting for results*

The MILES trial: a milestone

- Stabilization of lung function during the treatment period
- After discontinuation of sirolimus, the decline in lung function resumed and paralleled that in the placebo group

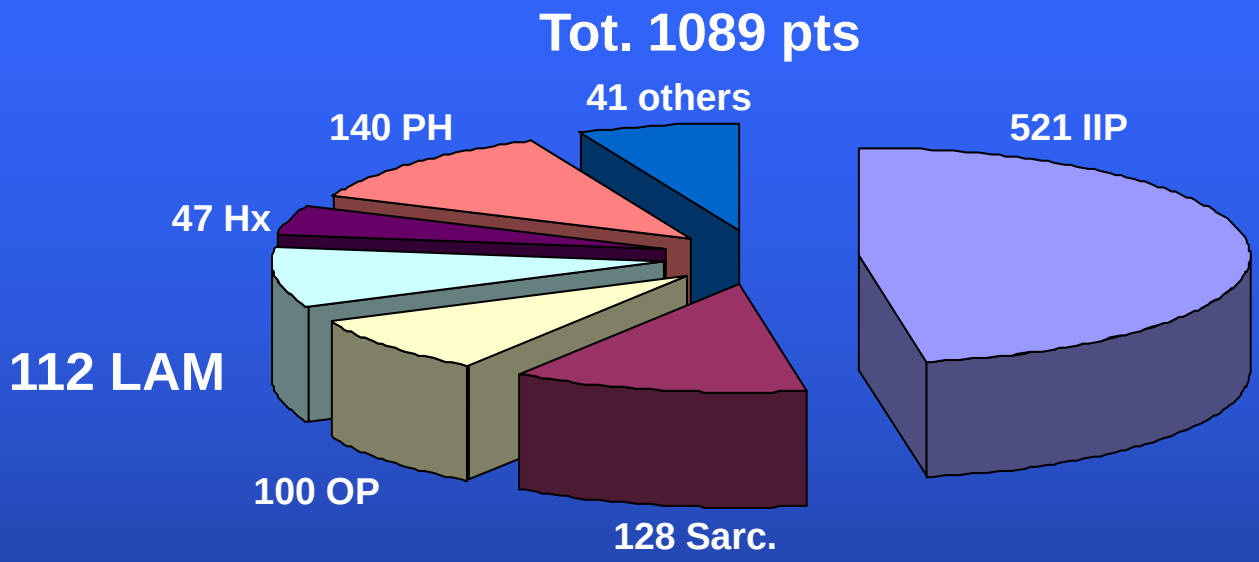


More common adverse effects:
Mouth ulcers, diarrhea, upper respiratory infections, hypercholesterolemia, acneiform rash

McCormack FX, NEJM 2011

Rare Lung Diseases

Ospedale San Giuseppe Experience (2001- 2014)



Mean age at diagnosis: 36 years

18 pts in post-menopausal age, 20 TSC-LAM

45 pts treated with Sirolimus

- FEV1 change in pre-treatment period: - 119 ml/year
- FEV1 change in treatment period: + 84 ml/year

3 pts showed declining lung function after two year treatment period

3 pts discontinued the therapy because of adverse events

Overall survival in 100 patients

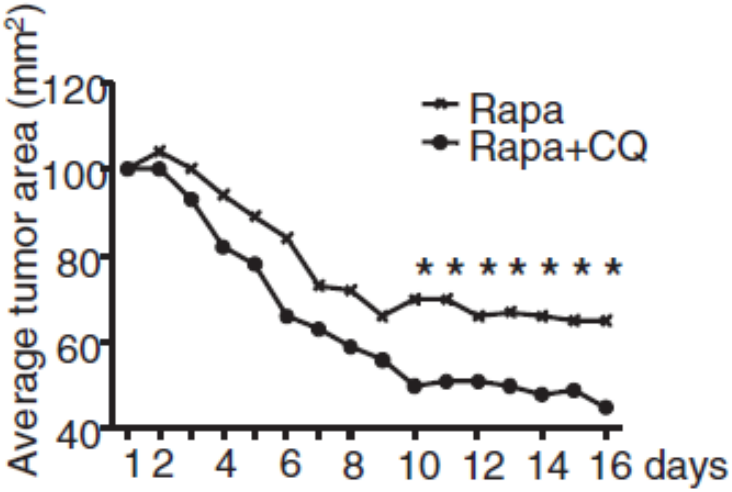
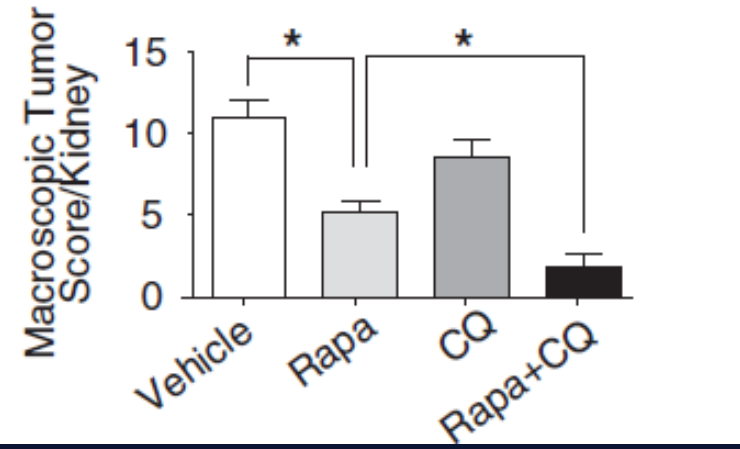
From bench to bedside
LAM: a good model





The combination of mTORC1 and autophagy inhibition (using rapamycin and chloroquine) is more effective than either treatment alone in inhibiting the survival of tuberin (TSC2)- null cells, growth of TSC2-null xenograft tumors, and development of spontaneous renal tumors in Tsc2+/− mice

Thus dual inhibition of mTORC1 and autophagy is a potential therapeutic strategy for TSC and LAM patients.

MicroRNA-21 is Induced by Rapamycin in a Model of Tuberous Sclerosis (TSC) and Lymphangioleiomyomatosis (LAM)

Anil J. Trindade, Douglas A. Medvetz, Nicole A. Neuman, Faina Myachina, Jane Yu, Carmen Priolo, Elizabeth P. Henske*

mTOR-inhibition by Rapamycin upregulates miR-21, a pro-survival miR

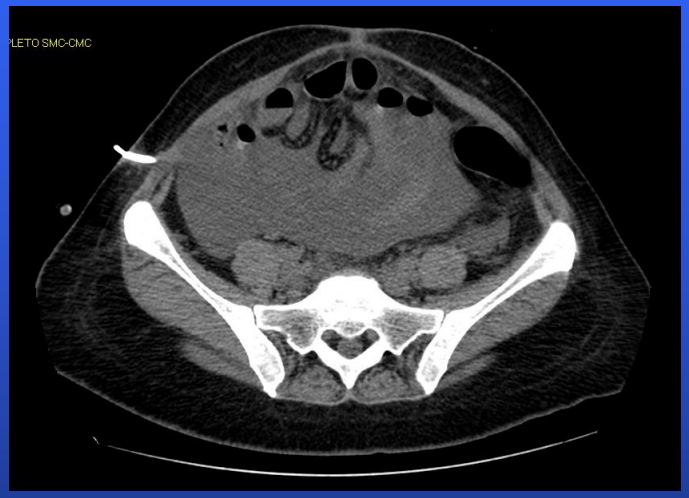
- **pro-survival effects of miR-21 may partially explain why there is a resumption of disease upon treatment discontinuation in LAM patients treated with Rapamycin**.
- miR-21 is a known regulator of smooth muscle morphology, promoting a de-differentiated state marked by growth and migration
- is possible that miR-21 induces a pro-inflammatory state that promotes the survival and metastasis of TSC2-deficient LAM cells.

Could suppression of miR-21 in conjunction with Rapamycin represent an effective therapeutic strategy for TSC and LAM?

Trindade AJ et al, PLOS 2013

A 39 years old woman with mild lung disease and a large abdominal lymphangioleiomiomas was referred to our centre for recurrent chylous ascites after every attempt of oral feeding

Before sirolimus



After 3 months of sirolimus

Rare diseases and “famous” therapies *Beta-blockers*

Beta-blockers and Portopulmonary Hypertension

10 patients - After beta-blockers (propanolol or atenolol) withdrawal:

- Improvement in exercise tolerance (Walk distance during 6MWT)

- Improvement in hemodynamics (increase in CO with no change in mPAP resulting in decreased pulmonary vascular resistance)

Provencher S et al, Gastroenterology 2006

Rare diseases and “famous” therapies
PAH and *Beta-blockers*

European Respiratory *review*

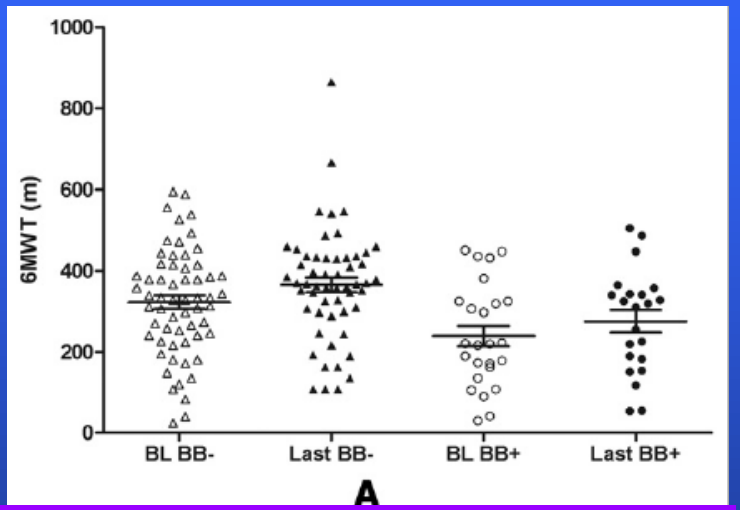
By common clinical consensus, beta-blocker use in PAH is contraindicated.
Neverthless there are several indicators of increased sympathetic activity affecting the right ventricle in PAH.

Could a low-dose of a newer selective beta-blocker might be a tolerable option to abolish the detrimental effects of sympathetic overdrive in PAH?

Handoko LM, Eur Resp Rev 2010

Rare diseases and “famous” therapies
PAH and *Beta-blockers*

Beta-Blocker statistics at baseline (n = 26)	
Type of β-blocker used	
Metoprolol	54%
Atenolol	8%
Bisoprolol	27%
Propranolol	4%
Acebutolol	4%
Nadolol	4%
Metoprolol-equivalent dose (mg), median (interquartile range)*	100 (50–100)



Most patients tolerate beta-blockers well and they do not appear to exert detrimental effects in clinical, functional, and hemodynamic outcomes in patients with PAH.

Although use of bradycardiac agents such as beta-blockers do carry the theoretical risk of decreasing cardiac output, careful use of beta-blockers in selected patients may be safe in those who do not demonstrate any adverse clinical effects.

So PPS et al, Am J Cardiol 2012;109:1504 –1509

Rare diseases and “famous” therapies
LAM and Statins

Evidence of RhoA GTPase activation in LAM-derived and human TSC2-null cells suggested that HMG-CoA reductase inhibitors statins can be used as potential adjuvant agents.

Combined treatment of rapamycin with simvastatin but not with atorvastatin showed a synergistic growth inhibitory effect on TSC2-null cells

Atochina-Vasserman EN et al, Am J Respir Cell Mol Biol, 2013 Aug

Rare diseases and "famous" therapies
ILD and Statins

- In a large cohort of smokers from COPDGene statin use was positively associated in ILA (odds ratio, 1.60; 95% confidence interval, 1.03–2.50; P ¼ 0.04) after adjustment for covariates
- Statin administration aggravates lung injury and fibrosis in bleomycin-treated mice
- Statins enhance NLRP3-inflammasome activation by increasing mitochondrial reactive oxygen species generation in macrophages.

Statins may influence the susceptibility to, or progression of, ILD

Rare diseases and exposure to drugs or toxins

- In the last three decades strong association between PAH and the use of anorexic drugs (mainly derivatives of fenfluramine) has been found

Douglas JG et al. Br Med J (Clin Res Ed) 1981; 283: 881–883
Brenot F et al. Br Heart J 1993; 70: 537–541.
Abenhaim L et al N Engl J Med 1996; 335: 609–616.

- Fenfluramine derivatives are potent serotonin (5-HT) uptake inhibitors and interact directly with the 5-HT transporter. 5-HT acts as growth factor for pulmonary artery smooth muscle cells

Eddahibi S et al. Respir. Res 2002; 3:9
Eddahibi S et al. Chest 2002; 121: Suppl. 3, 97S–98S.
Eddahibi S et al. J Clin Invest 2001; 108: 1141–1150 .

Rare diseases and exposure to drugs or toxins

Pulmonary arterial hypertension associated with fenfluramine exposure: report of 109 cases

Bel EH et al. Eur Respir Rev. 2013;22:227-235

Conclusions

- **In the last two decades "a global effort" against orphan and rare diseases has been made leading to a progress in diagnosis and treatment.**
- **Translational research has become essential to find new approaches for diagnosis and treatment of rare diseases**
- **Patient organizations and registries are very important to support and improve both basic and clinical research on rare diseases (e.g. LAM associations)**
- **Research into rare diseases may be limited by a relative inability to capture sufficiently large patient populations.**
